

EDUCATION

Northeastern University

Master of Science in Computer Science (GPA 3.8/4)

◦ Relevant Coursework: Large Language Models, Computer Vision, Data Mining, Database Systems

Boston, MA

August 2023 – Dec 2025

PROFESSIONAL EXPERIENCE

Eagle

Founding AI/Forward Deployed Engineer

New York, NY

Jan 2026 – Present

- Cut thermal load calculation time 80% (300 hours to 59 hours) at 96.2% accuracy, by building an engine that turns a 3D building model into a finished calculation report with minimal manual work.
- Embedded directly with mechanical engineers to learn their workflow from scratch, split across Revit, Bluebeam, and spreadsheets, automating their most tedious tasks and unified their entire process into a single platform.
- Hit 90%+ accuracy decomposing construction blueprints, one of the hardest document types to parse, with a computer vision, vision-language models helping engineers do QA, search and navigation.
- Cut business-opportunity research time by 10x (50 hours to 5 hours) for GTM teams by building 15 custom scrapers + AI agents that analyze unstructured web data and surface ready-to-pursue signals.

Apriqot

Machine Learning Engineer

Portland, ME

July 2024 – Jan 2025

- Engineered disease and food insecurity predictive models to produce geographically and demographically downscaled population health estimates in the state of Maine.
- Leveraged small area estimation to derive precise health/food insecurity metrics, representing an increase in 5% of predicted food insecurity from the study by state officials.
- These results were used by healthcare stakeholders like MaineCDC and MaineHealth to make major strategic decisions.

Institute for Experiential AI

Data Science Researcher

Boston, MA

Jan 2024 – Dec 2025

- Developed a framework for integrating deep learning models (GCN + LSTM) with Boston urban rail infrastructure (MBTA) and strategies for terrorist/natural disaster identification and response, funded by the Department of Homeland Security.
- Achieved low error (RMSE $\approx$ 0.026–0.045) while building a system to predict which MBTA rail stations are most attractive to attack by time of day, so operators can harden the right places first.

AI/ML PROJECTS

• Jeffy AI: Voice-Powered Workout/Health Tracker : [Demo](#)

- Built a voice-first assistant that uses Speech-to-Text ML models + LLM function-calling to turn spoken workout descriptions directly into structured, logged exercise data.
- Added guardrails & logging for failed checks; enforced schema validation.
- Shipped it as a real production web app with cross-device sync and authentication.

• Elliot: Autonomous Engineering Manager : [Demo](#)

- Deployed a multi-agent “AI employee” that autonomously handles task triage, team communication, and scheduling across Linear, Slack, and Google Calendar via voice and MCP tool execution.
- Built self-correction into the agent’s tool calls, validating each action before execution and retrying on failure with an evaluation harness including post-incident summaries giving full traceability into what the agent did and why.

TECHNICAL SKILLS

AI/ML: LLMs, VLMs, Computer Vision, PyTorch, TensorFlow, Transformers, NetworkX, OpenCV, Roboflow, LangChain, Pydantic AI, Langfuse, N8N

Programming & Infrastructure: Python, TypeScript, JavaScript, Java, R, HTML, React, Postgres, MySQL, MongoDB, AWS, Google Cloud Run, Railway
